therein in some formats, e.g., audio or CD-ROM and capable of storing between 450-500 Megabytes of digital information in other formats, e.g., DVD. A first non-metallic zone 36 (see also 36' of FIGS. 2B and 5 and 36" of FIG. 7) surrounds and extends outwardly a predetermined distance from the medial opening 32. A second non-metallic zone 38 extends inwardly from the rectangular outer perimeter of the trading card optical compact disc 20 a predetermined distance. The first non-metallic zone 36 preferably includes a stacking ring 37 (see also 37' of FIGS. 2B and 5 and 37" of FIG. 7) surrounding the opening 32 for stacking another optical compact disc thereon such as used during mass production. It will be understood by those skilled in the art, however, that the stacking ring 37 is not necessary in the construction of the trading card optical compact disc 20 according to the present invention. --

In the Claims:

Please cancel Claims 1-34

Please add new Claims 35-43 as follows:

35. A method of forming an optical compact disc, the method comprising the step of molding at least one plastic layer having a pattern of digital data encoded thereon, the at least one plastic layer having a major elevational portion and a minor elevational portion, the major elevational portion

having the encoded digital data thereon and the minor elevational portion being devoid of the encoded digital data.

36. A method as defined in Claim 35, wherein the major elevational portion is formed in a medial portion of the optical compact disc and has first and second pairs of spaced-apart outer side peripheries defining outer boundaries of the major elevational portion, each of the first pair of spaced-apart outer side peripheries arcuately extending between each of the second pair of spaced-apart outer side peripheries, and each of the second pair of spaced-apart outer side peripheries extending substantially linearly between each of the first pair of spaced-apart outer peripheries.

- 37. A method as defined in Claim 36, wherein the encoded digital data of the major portions of the plastic layer is formed within a circular data zone and comprises less than the entire surface area of the major elevational portion of the plastic layer.
- 38. A method as defined in Claim 37, wherein the step of molding the plastic layer includes molding an opening extending through a medial portion of the plastic layer.
- 39. A method as defined in Claim 38, further comprising the step of applying a metallic layer on at least portions of the plastic layer.

40. A method as defined in Claim 39, further comprising the step of applying a third protective layer on at least the metallic layer for protecting the metallic layer.

- 41. A method as defined in Claim 40, further comprising the step of applying an indicia bearing layer on the third layer and having a generally planar upper surface for displaying indicia therefrom.
- 42. A method of forming an optical compact disc, the method comprising the step of:

molding a compact disc having a pattern of digital data encoded thereon, the compact disc having first and second pairs of spaced-apart outer side peripheries defining outer boundaries of at least portions of the disc, each of the first pair of spaced-apart outer side peripheries arcuately extending between each of the second pair of spaced-apart outer side peripheries extending substantially linearly between each of the first pair of spaced-apart outer peripheries.

43. A method as defined in Claim 42, further comprising positioning an opening in a medial portion of the compact disc, wherein each of the arcuately-extending first pair of spaced-apart outer side peripheries of the portion of the disc are centered about an axis extending through the medial opening and substantially perpendicular to the linearly-extending second pair of spaced-apart outer side peripheries, and wherein a radius extending from a medial
